

Estimating building inventory for rapid seismic vulnerability assessment in Bishkek, Kyrgyzstan

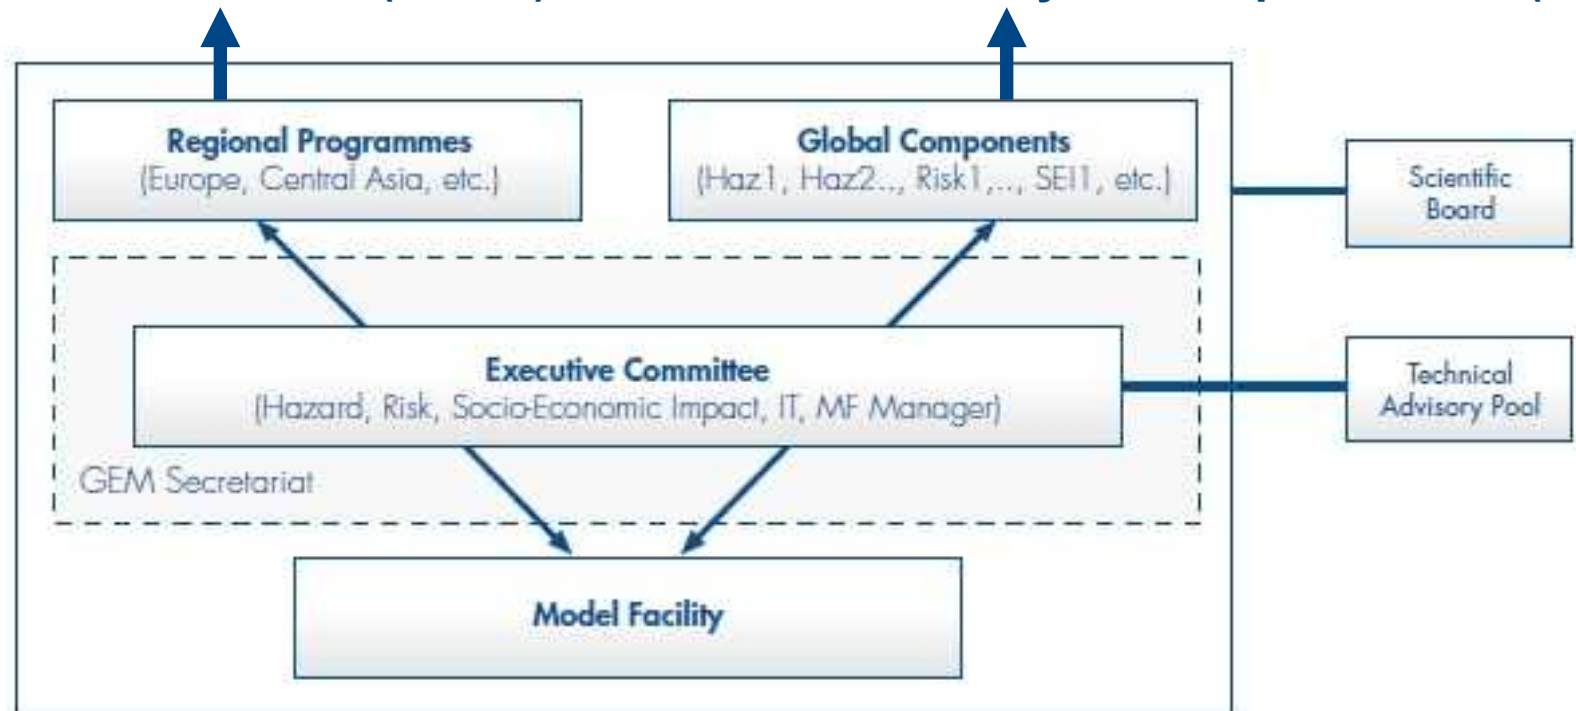

an integrated approach based on multi-source imaging and GIS

M. Wieland, M. Pittore, S. Parolai, J. Zschau

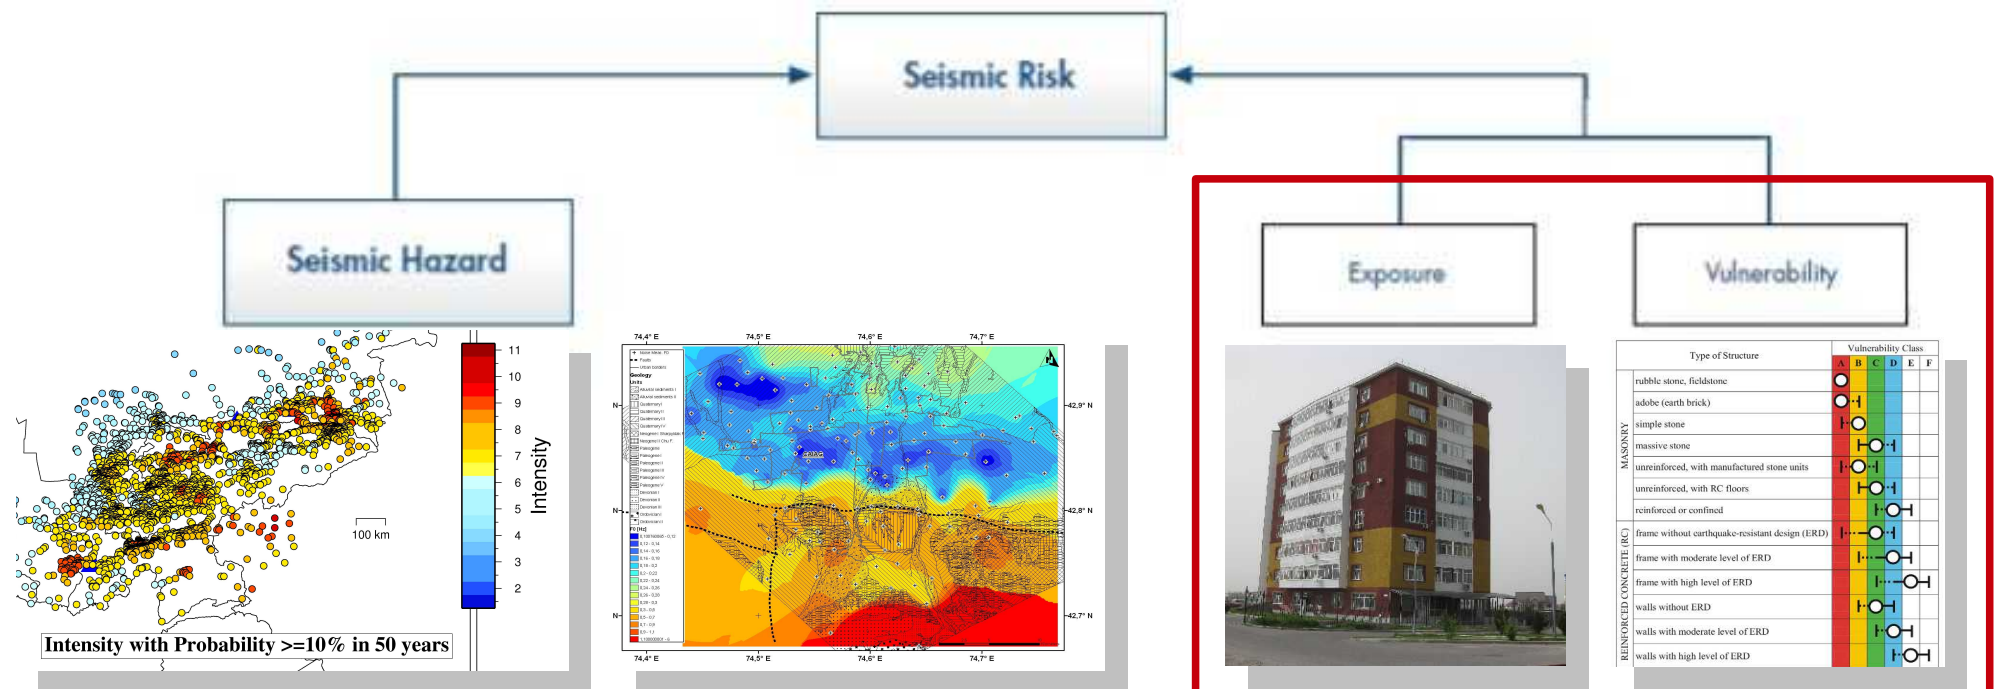

Earthquake Model Central Asia (EMCA)

Inventory Data Capture Tools (IDCT)

Earthquake Model Central Asia (EMCA) Coordinated by GFZ

Motivation

Vulnerability building by building

Building number	Building floor	The constructive decision	Building subgroup on classification EMS-98
1	Three- floor building with a ground floor	Building with bearing brick walls and ferro-concrete overlappings	B
		crete frame with brick walls and ferro-concrete	D
		crete frame with brick walls and ferro-concrete	C
	

Vulnerability composite

Population: 865.527 people (status 2009)

Built-up area 2009: 235 km² (from satellite images)

Built-up area 1994: 152 km² (from satellite images)

Built-up area 1977: 117 km² (from satellite images)

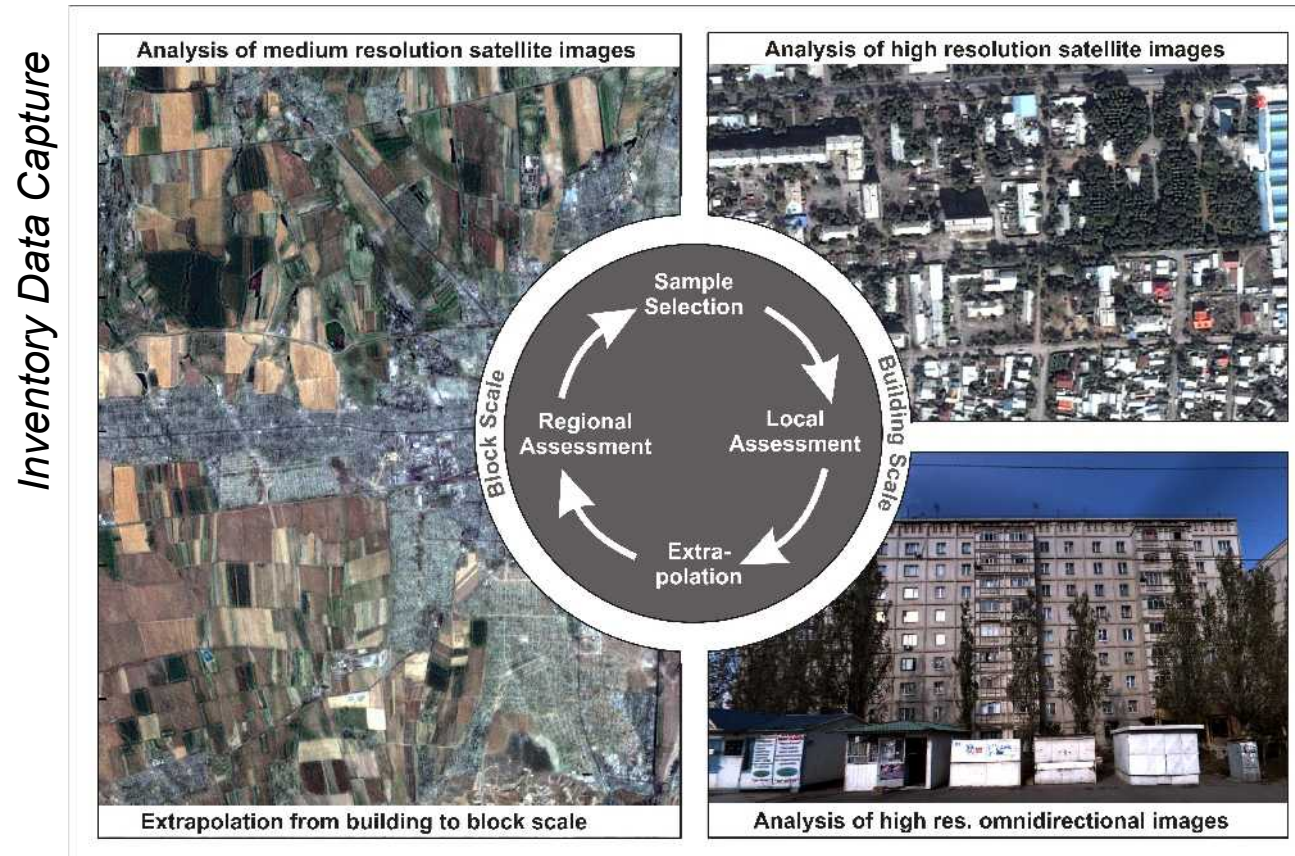

Vision

- A **rapid visual survey** can lead to a reasonable first assessment over broad areas.
- By coupling remote sensing (topview) with omnidirectional imaging (streetview), this could be done in an optimal way (in terms of time and resources).

- **Open-source** tools, **low-cost** data sources.
- **Globally applicable** on regional and local scale.

Overview of the approach

Probabilistic Framework

Inventory Database

Hazard Assessment

Risk Assessment

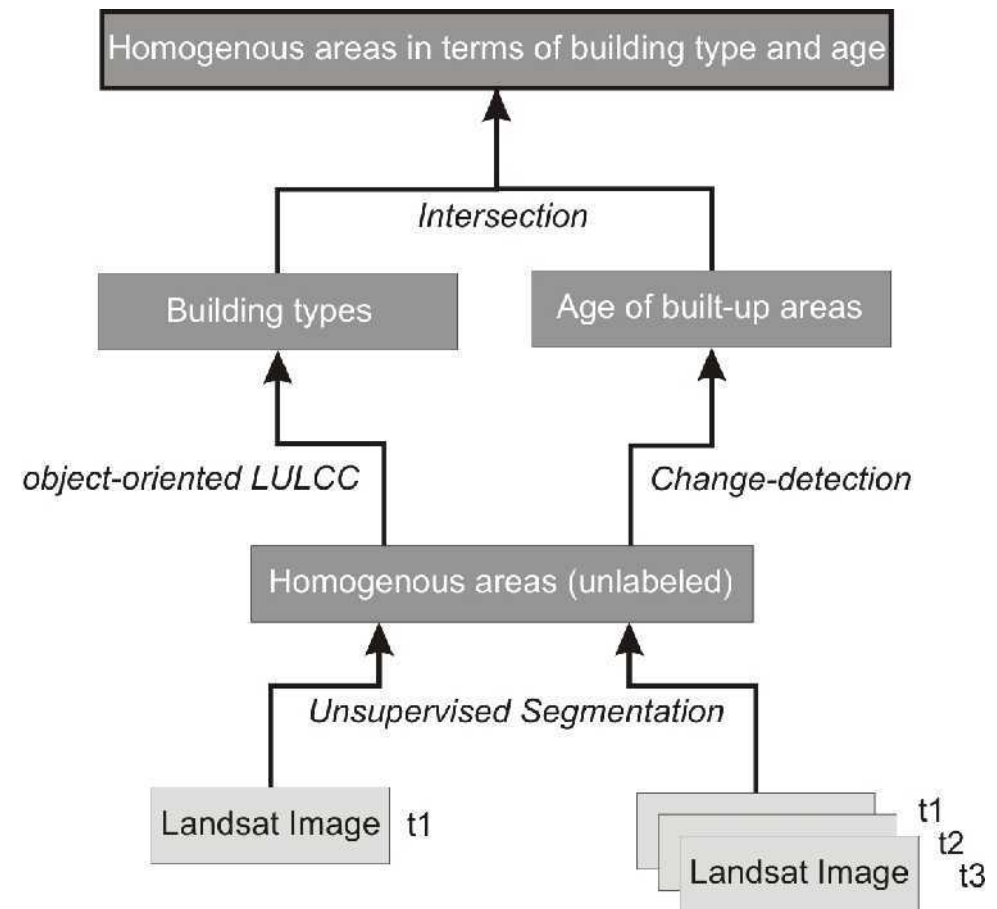

Analysis of medium-resolution satellite images

Stage of Stratification

Pixels

Workflow / Results

Pixels → Segments → Thematic Classes → Urban Structure Types

Analysis of medium-resolution satellite images

Stage of Stratification

Thematic class (LULC)

Workflow / Results

L1 (general)	L2 (general)	L3 (Bishkek)
urban	residential	1-2 storey masonry, brick, clay – type 1
		1-2 storey masonry, brick, clay – type 2
		1-2 storey masonry, brick, clay – type 3
		3-6 storey masonry, brick, concrete, panel
		7-9 storey concrete, panel, frame, monolithic
	industrial / commercial	
	mixed built-up	
	vegetation	
	water	
	other (rock, soil)	

Analysis of medium-resolution satellite images

Stage of Stratification

Thematic Class (Age of built-up areas)

Workflow / Results

08.07.2009 Landsat TM

built-up area: 235 km²
growth rate (1994-2009): 55 %

15.07.1994 Landsat TM

built-up area: 152 km²
growth rate (1977-1994): 30 %

22.08.1977 Landsat MSS

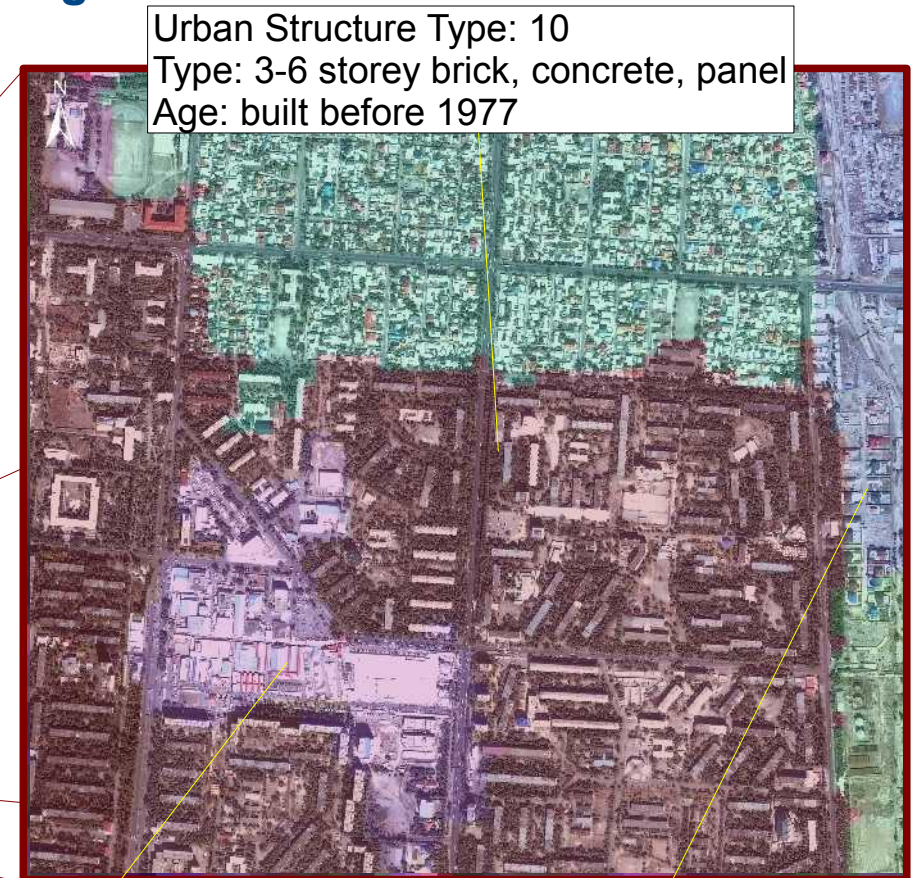

built-up area: 117 km²

Analysis of medium-resolution satellite images

Stage of Stratification

Urban Structure Types

Urban Structure Type: 10
Type: 3-6 storey brick, concrete, panel
Age: built before 1977

Urban Structure Type: 16
Type: industrial, commercial
Age: built before 1977

Urban Structure Type: 8
Type: 1-2 storey masonry, brick
Age: built between 1994 and 2009

Stratified sampling and analysis of high-resolution satellite images

Extraction of building footprint and location

Sample areas

Quickbird R-G-B (3-2-1)

Building shape, area, roof-type, roof-color/-material, etc.

Acquisition and analysis of high-resolution omnidirectional images

Omnidirectional Image

Acquisition and analysis of high-resolution omnidirectional images

Omnidirectional Camera

Navigation Unit

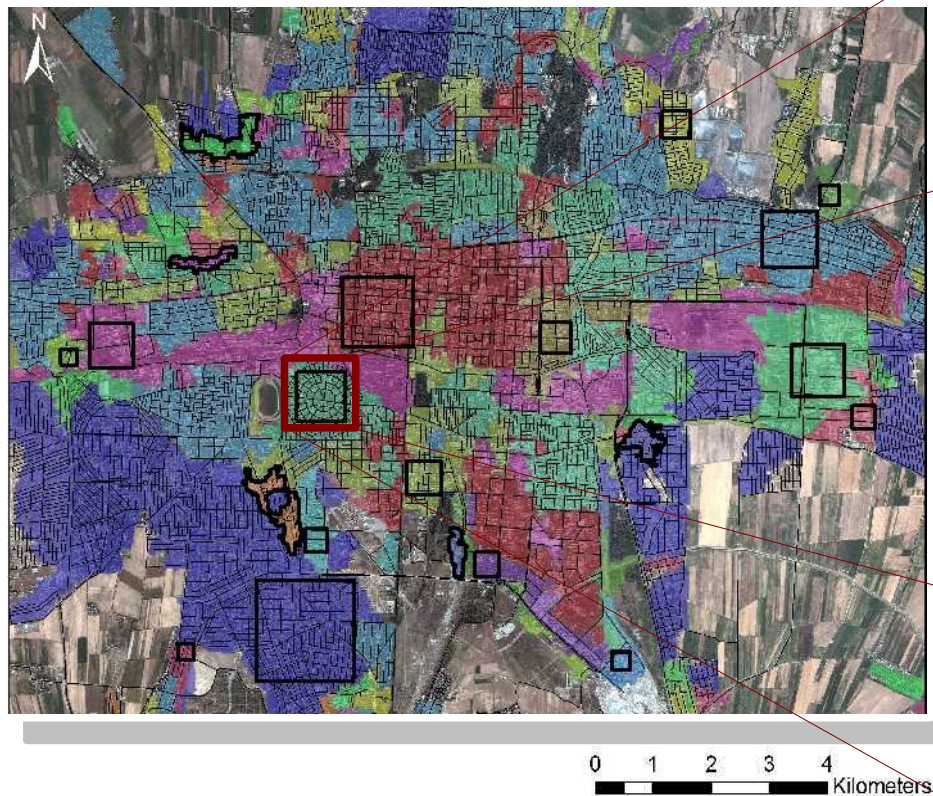

System mounted on car

Acquisition and analysis of high-resolution omnidirectional images

Travelling Salesman Problem (TSP)

Sample areas and OpenStreetMap

0 125 250 375 500
Meters

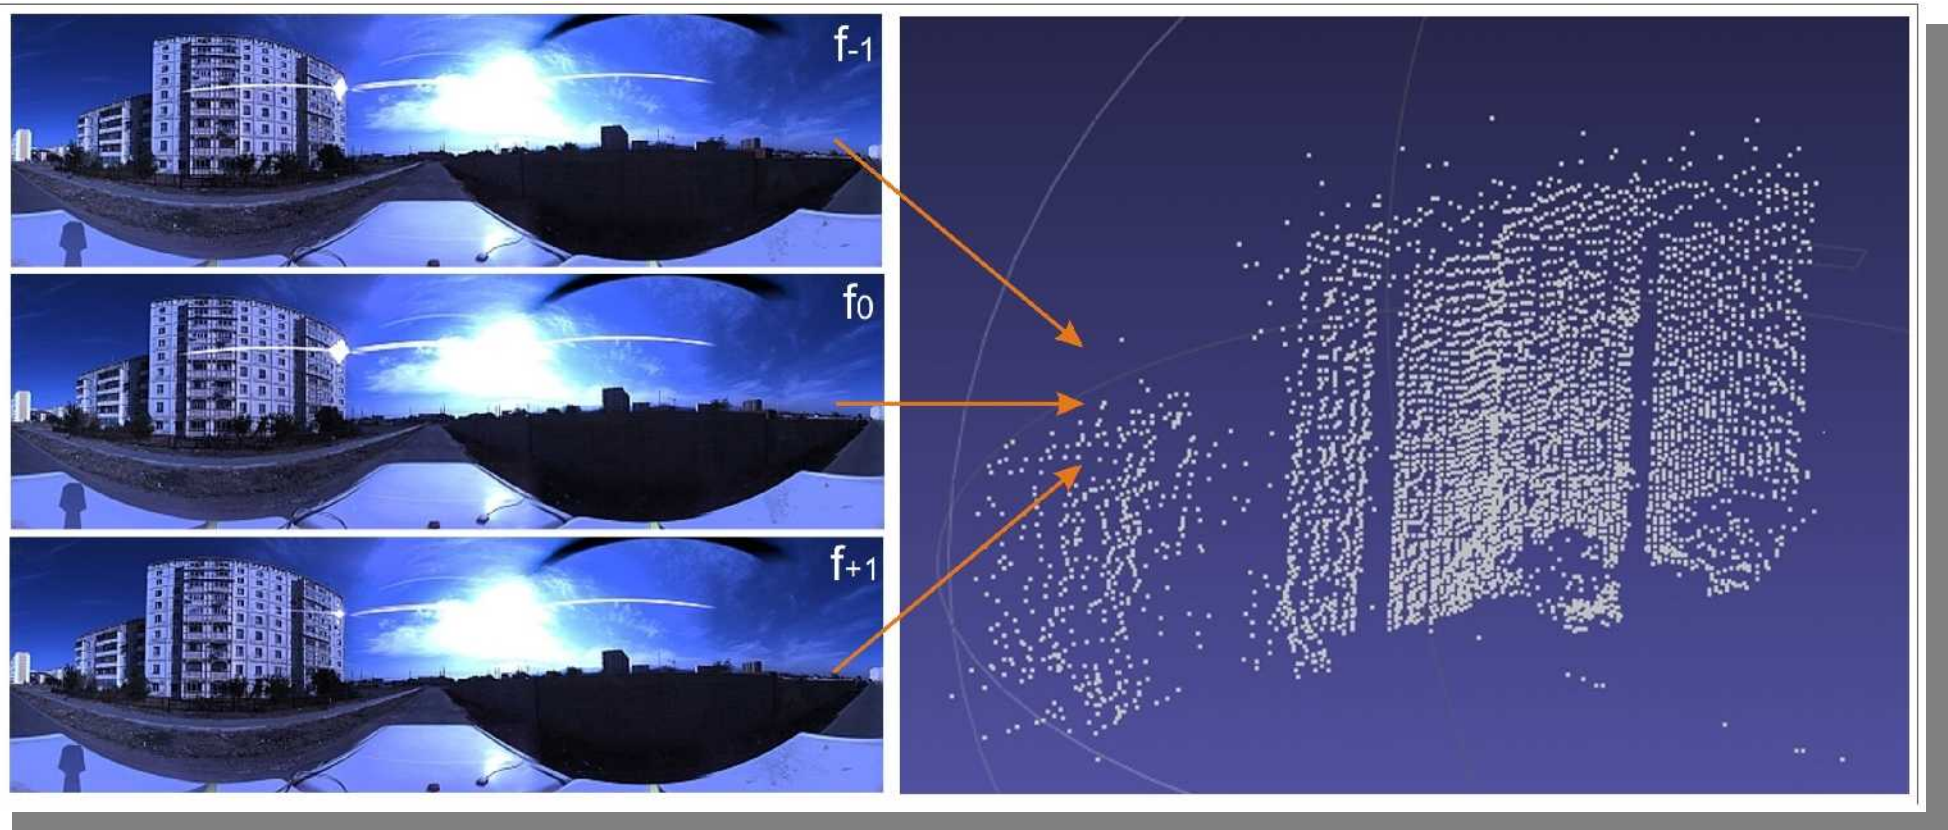

Acquisition and analysis of high-resolution omnidirectional images

Omnidirectional Imagestream

Acquisition and analysis of high-resolution omnidirectional images

Automated height measurement from 3D-points

Acquisition and analysis of high-resolution omnidirectional images

Automated height measurement from 3D-points

Vertical shape, soft-storey detection, nr. of windows, etc.

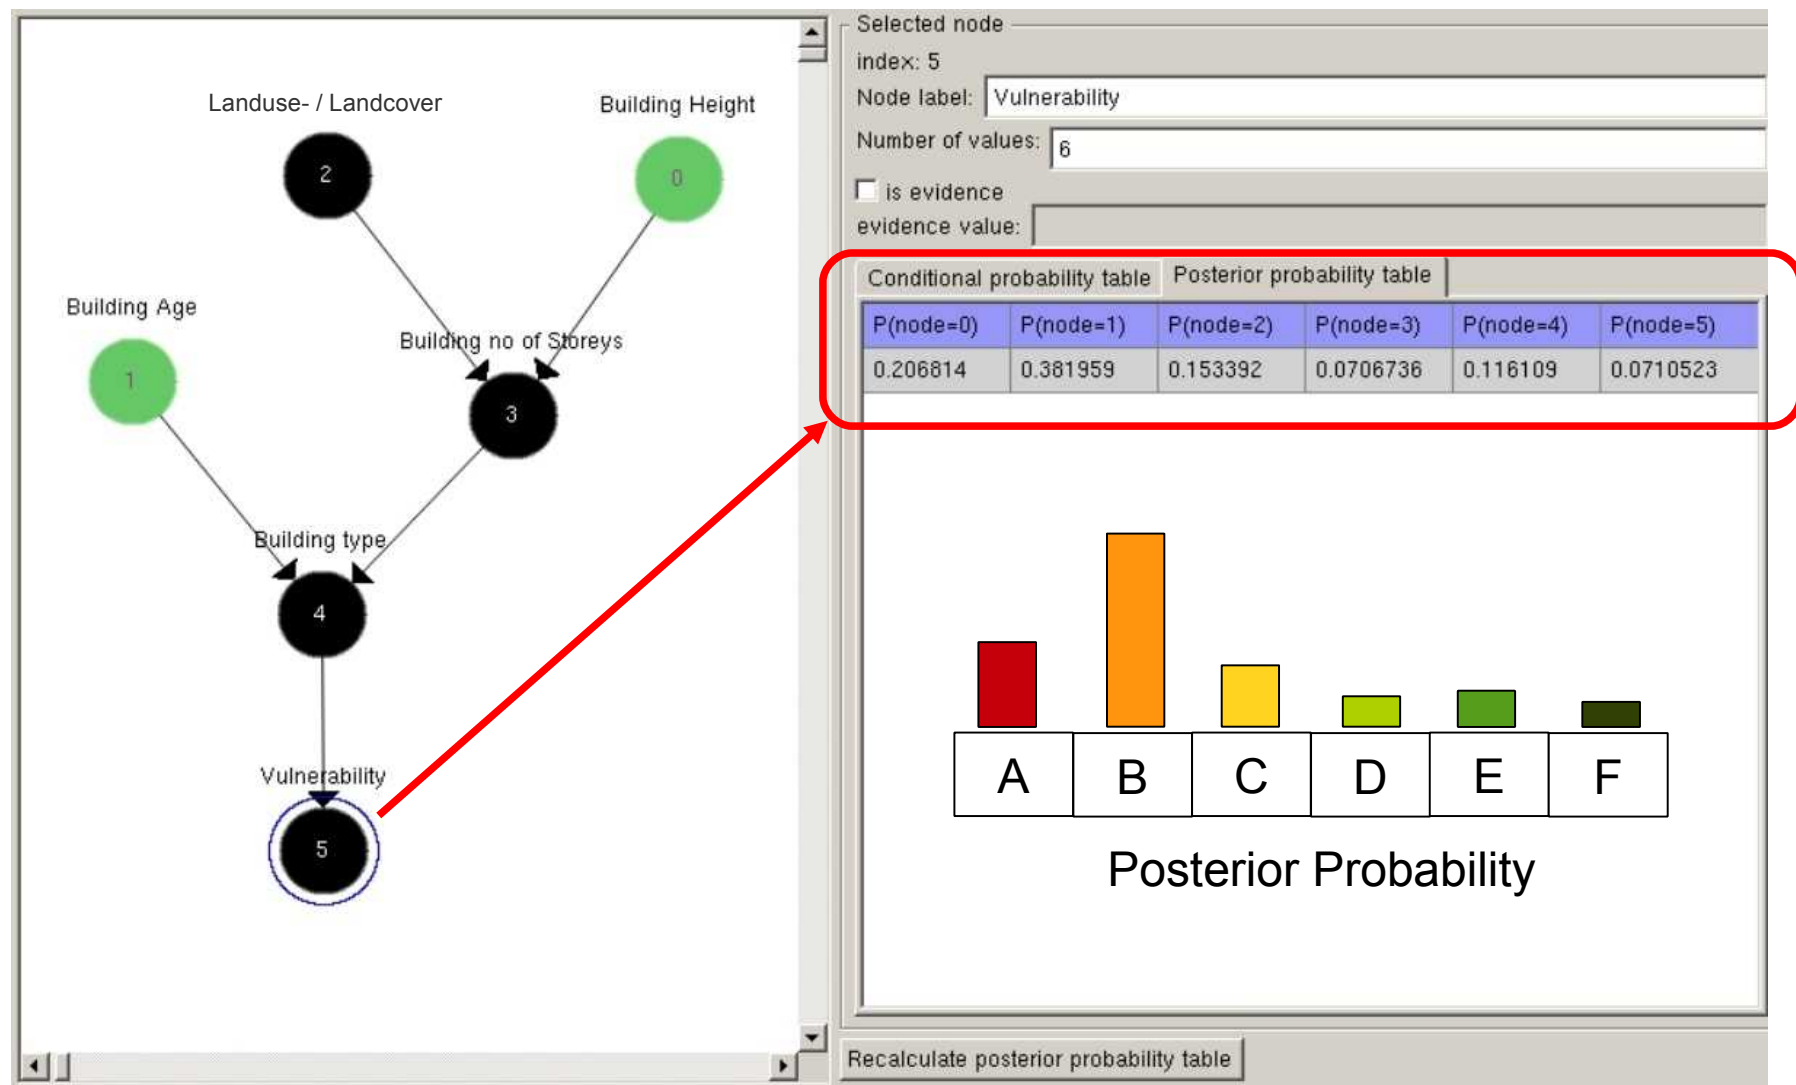

Data integration

- ***Priors from medium-resolution satellite images***
 - Estimated Age
 - Land-Use / Land-Cover (LULC)
- ***Information from high-resolution satellite images:***
 - *Building footprints*
 - ...
- ***Information from omnidirectional images:***
 - *Estimated Height of Structures*
 - ...
- ***Priors from manual data entry :***
 - Expert knowledge
 - Ancillary data

VULNERABILITY

Vulnerability estimation (EMS-98): bayesian network

Vulnerability estimation (EMS-98): building scale

Age: 1994-2009
Nr. of storeys: 9
Type: 5-9 storey,
concrete, panel,
frame
Vuln: E

Vulnerability estimation (EMS-98): extrapolation to district scale

Work in progress...

Conclusion

- Stratified **sampling** using remote sensing proved **successful**.
- Omnidirectional imaging: **fast** deployed, **easily** operated.
- Feature **extraction** from remote sensing proved **feasible**.
- **Automatic** extraction from omnidirectional images proved **feasible**.
- Bayesian approach to **data fusion** seems promising.
- Approach is **scalable**, flexible and transferable.
- All tools are **open** source and costs for data can be reduced to a minimum.

Thank you for your attention!
